....not cut apart or otherwise deformed. Relationship among views is clear. It is easy to understand relative positions orientations subvolumes or slices. Visual cues include connecting lines, visual landmarks, overlap between views, colour, etc. In other words, there is visual momentum [19]. Figure 5: Visualization of a fuel cell. The overview shows an isosurface of temperature. Two copies of a slice show concentrations of hydrogen (plane closest to overview) and oxygen (furthest from overview) The colour scale shows increasing concentration from green to blue (light to dark in

[Enhancing Information Visualization with Motion - By Linda Ruth \(2001\)](#) (Correct)

.... perceptual field over which we have a restricted range of foci and emphasises the need for perceptually efficient orienting cues to alert the user to the fact that something interesting is going on another part of the perceptual field without unduly grabbing attention from the current task focus (Woods 1984). 1.2 Integrating scattered information An important issue in visualization environments is the visual fragmentation caused by multiple views of related information distributed across representations, windows and even screens. The challenge is to visually support the user in the information

....crowded display, indeed which may include several different windows, and across which the user has to find various related pieces. Display proliferation imposes significant burdens in mental integration and the assembling of information for problem solving across disparate displays and surfaces (Woods 1984, Bainbridge 1991, Ware 2000) Our previous work with a multi screen interface identified the need for integrative cues to perceptually connect data in disparate displays (Bartram et al. 1995) It is common for users to inspect various views of data in different contexts as part of monitoring,

....information processing characteristics into principles and techniques for human computer interface design. More specific examples are developing principles for graphic display design that capitalize on human perceptual characteristics (Cleveland, 1985; Sanderson, Haskell, and Flach, 1992; Woods, 1984), developing models of human performance that enable explicit consideration of human memory and attention processing constraints in system design (Card, Moran, and Newell, 1983; Kieras and Polson, 1985) and developing principles for the design of error tolerant systems
